Hi

I agree with any programs that improves our environment.

When it comes to water management in WA, I believe that we can do better. We have two large River systems that collect fresh water and it spills into the sea via the Swan and Murray Rivers. I believe that it would make sense if we looked at containing the outflow of these rivers by means of barriers similar to those that have been constructed in Singapore. This would give us large , fresh water reservoirs , where the excess could be allowed to spill into the Atlantic.

The first thing that you will say is that it would be very expensive to achieve this, but think of the gains in the future, where these reservoirs would pay for themselves many times over.

Regards

Don Maclure
